

[INTEGRATED HEADSET FOR ANY TWO-WAY- COMMUNICATION DEVICE]

Abstract of Disclosure

A head set device that is incorporated into a hand held electronic device such as a cellular phone, or portable digital assistant. The headset is manufactured with an earpiece for receiving sound, and a microphone for transmitting sound. In the electronic device are an indentation for storage of the earpiece and microphone, and a lock switch for securing the earpiece and microphone in the electronic device while not in use. The headset also has a retractable cord to extend the earpiece and microphone from the hand held device to place the earpiece in the ear canal. In another embodiment of the present invention the earpiece and microphone can function on a wireless transmitter, removing the need for the retractable cord.
